## Non-Relational Postgres

BRUCE MOMJIAN

This talk explores the advantages of non-relational storage, and the Postgres support for such storage.

https://momjian.us/presentations

Last updated: July 2025

## Relational Storage

- Relational storage was proposed by E. F. Codd in 1970
- 50+ years still in use
- Very flexible
- Not always ideal

# What Is Relational Storage?

- Row, column, table (tuple, attribute, relation)
- Constraints
- Normalization, joins

#### What Is Data Normalization? First Normal Form

- Each column/attribute contains only atomic indivisible values:
- Eliminate repeating groups in individual tables
- Create a separate table for each set of related data
- Identify each set of related data with a primary key

#### Downsides of First Normal Form

- Query performance
- Query complexity
- Storage inflexibility
- Storage overhead
- Indexing limitations

# Postgres Non-Relational Storage Options

- 1. Arrays
- 2. Range types
- 3. Geometry
- **4.** XML
- 5. JSON
- 6. JSONB
- 7. Row types
- 8. Character strings

### 1. Arrays

```
CREATE TABLE employee
(name TEXT PRIMARY KEY, certifications TEXT[]);
INSERT INTO employee
VALUES ('Bill', '{"CCNA", "ACSP", "CISSP"}');
SELECT * FROM employee:
 name | certifications
Bill | {CCNA, ACSP, CISSP}
SELECT name
FROM employee
WHERE certifications @> '{ACSP}';
 name
Bill
```

All queries used in this presentation are available at https://momjian.us/main/writings/pgsql/non-relational.sgl.

## Array Access

```
SELECT certifications[1]
FROM employee;
 certifications
CCNA
SELECT unnest(certifications)
FROM employee;
 unnest
CCNA
ACSP
CISSP
```

# Array Unrolling

```
SELECT name, unnest(certifications)
FROM employee;
name | unnest
-------
Bill | CCNA
Bill | ACSP
Bill | CISSP
```

# **Array Creation**

```
SELECT DISTINCT relkind
FROM pg class
ORDER BY 1;
 relkind
SELECT array agg(DISTINCT relkind)
FROM pg_class;
 array_agg
{i,r,t,v}
```

# 2. Range Types

```
CREATE TABLE car rental
(id SERIAL PRIMARY KEY, time span TSTZRANGE);
INSERT INTO car rental
VALUES (DEFAULT, '[2016-05-03 09:00:00, 2016-05-11 12:00:00)');
SELECT *
FROM car rental
WHERE time span @> '2016-05-09 00:00:00'::timestamptz;
id |
                           time span
  1 | ["2016-05-03 09:00:00-04", "2016-05-11 12:00:00-04")
SELECT *
FROM car rental
WHERE time span @> '2018-06-09 00:00:00'::timestamptz;
 id | time span
```

# Range Type Indexing

```
INSERT INTO car rental (time span)
SELECT tstzrange(y, y + '1 day')
FROM generate series('2001-09-01 00:00:00'::timestamptz,
                     '2010-09-01 \ 00:00:00'::timestamptz, '1 \ day') AS x(y);
SELECT *
FROM car rental
WHERE time span @> '2007-08-01 00:00:00'::timestamptz;
  id
                             time span
2162 | ["2007-08-01 00:00:00-04", "2007-08-02 00:00:00-04")
EXPLAIN SELECT *
FROM car rental
WHERE time span @> '2007-08-01 00:00:00'::timestamptz;
                                 QUERY PLAN
 Seq Scan on car rental (cost=0.00..64.69 rows=16 width=36)
   Filter: (time span @> '2007-08-01 00:00:00-04'::timestamp with time zone)
```

# Range Type Indexing

```
CREATE INDEX car rental idx ON car rental
USING GIST (time span):
EXPLAIN SELECT *
FROM car rental
WHERE time span @> '2007-08-01 00:00:00'::timestamptz;
                                      OUERY PLAN
 Bitmap Heap Scan on car rental (cost=4.27..28.35 rows=16 width=36)
   Recheck Cond: (time span @> '2007-08-01 00:00:00-04'::timestamp with time zone)
   -> Bitmap Index Scan on car rental idx (cost=0.00..4.27 rows=16 width=0)
         Index Cond: (time span @> '2007-08-01 00:00:00-04'::timestamp with time zone)
```

#### **Exclusion Constraints**

```
ALTER TABLE car_rental ADD EXCLUDE USING GIST (time_span WITH &&);

INSERT INTO car_rental
VALUES (DEFAULT, '[2003-04-01 00:00:00, 2003-04-01 00:00:01)');

ERROR: conflicting key value violates exclusion constraint "car_rental_time_span_excl"

DETAIL: Key (time_span)=(["2003-04-01 00:00:00-05","2003-04-01 00:00:01-05"))
conflicts with existing key (time_span)=(["2003-04-01 00:00:00-05","2003-04-02 00:00:00-05")).
```

## 3. Geometry

```
CREATE TABLE dart (dartno SERIAL, location POINT);
INSERT INTO dart (location)
SELECT CAST('(' || random() * 100 || ',' ||
            random() * 100 || ')' AS point)
FROM generate series(1, 1000);
SELECT *
FROM dart
LIMIT 5:
dartno |
                       location
      1 | (60.1593657396734.64.1712633892894)
         (22.9252253193408,38,7973457109183)
          (54.7123382799327,16.1387695930898)
          (60.5669556651264,53.1596980988979)
         (22.7800350170583,90.8143546432257)
```

### Geometry Restriction

```
-- find all darts within four units of point (50, 50)
SFLFCT *
FROM dart
WHERE location <0 < (50, 50), 4>:::circle;
dartno |
                     location
    308 | (52.3920683190227,49.3803130928427)
    369 \ (52.1113255061209.52.9995835851878)
    466 | (47.5943599361926,49.0266934968531)
    589 | (46.3589935097843,50.3238912206143)
    793 | (47.3468563519418,50.0582652166486)
EXPLAIN SELECT *
FROM dart
WHERE location <@ '<(50, 50), 4>'::circle;
                      OUERY PLAN
 Seq Scan on dart (cost=0.00..19.50 \text{ rows}=1 \text{ width}=20)
   Filter: (location <@ '<(50.50).4>'::circle)
```

## **Indexed Geometry Restriction**

```
CREATE INDEX dart_idx ON dart
USING GIST (location);

EXPLAIN SELECT *
FROM dart
WHERE location <@ '<(50, 50), 4>'::circle;
QUERY PLAN

Index Scan using dart_idx on dart (cost=0.14..8.16 rows=1 width=20)
Index Cond: (location <@ '<(50,50),4>'::circle)
```

## Geometry Indexes with LIMIT

```
-- find the two closest darts to (50, 50)
SELECT *
FROM dart
ORDER BY location <-> '(50, 50)'::point
LIMIT 2:
dartno |
                      location
    308 | (52.3920683190227,49.3803130928427)
    466 | (47.5943599361926,49.0266934968531)
EXPLAIN SELECT *
FROM dart
ORDER BY location <-> '(50, 50)'::point
LIMIT 2:
                                    OUERY PLAN
 Limit (cost=0.14..0.30 rows=2 width=28)
   -> Index Scan using darts idx on darts (cost=0.14..80.14 rows=1000 width=28)
         Order By: (location <-> '(50,50)'::point)
```

#### 4. XML

```
$ # Run with foomatic installed, or download:
$ # https://www.openprinting.org/download/foomatic/foomatic-db-4.0-current.tar.gz
$ cd /usr/share/foomatic/db/source/opt
$ for FILE in *.xml
      tr -d '\n' < "$FILE"
      echo
done > /tmp/foomatic.xml
$ psq1
CREATE TABLE printer (doc XML):
COPY printer from '/tmp/foomatic.xml';
```

# Xpath Query

# Remove XML Array

# Xpath to XML Text

# Xpath to SQL Text

```
-- convert to SOL text so we can do DISTINCT and ORDER BY
SELECT DISTINCT text((xpath('/option/arg shortname/en/text()', doc))[1])
FROM printer
ORDER BY 1
LIMIT 5;
     text
 AlignA
 AlignB
 AlignC
 AlignD
 AllowReprint
```

# XML Non-Root Query

## Unnest XML Arrays

```
SELECT DISTINCT unnest((xpath('//driver/text()', doc))::text[])
FROM printer
ORDER BY 1
LIMIT 5;
   unnest
-----
ap3250
appledmp
bj10
bj10e
bj10e
bj10v
```

#### Search XML Text

```
WITH driver (name) AS (
    SELECT DISTINCT unnest(xpath('//driver/text()', doc))::text
    FROM printer
SELECT name
FROM driver
WHERE name LIKE 'hp%'
ORDER BY 1;
    name
 hpdj
 hpijs
 hpijs-pcl3
 hpijs-pcl5c
 hpijs-pcl5e
```

# 5. JSON Data Type

- JSON data type, not to be confused with JSONB
- Similar to XML in that the JSON is stored as text and validated
- ~100 JSON functions

# Load JSON Data

```
-- download sample data from https://www.mockaroo.com/
-- remove 'id' column, output as JSON, uncheck 'array'
CREATE TABLE friend (id SERIAL, data JSON);
COPY friend (data) FROM '/tmp/MOCK DATA.json';
SELECT *
FROM friend
ORDER BY 1
LIMIT 2:
 id |
                                data
  1 | {"gender": "Male", "first name": "Eugene", "last name": "Reed", ...
  2 | {"gender":"Female", "first name": "Amanda", "last name": "Morr...
```

# Pretty Print JSON

```
SELECT id, jsonb pretty(data::jsonb)
FROM friend
ORDER BY 1
LIMIT 1;
 id |
                   jsonb pretty
          "email": "ereedO@businesswire.com",+
          "gender": "Male".
          "last name": "Reed",
          "first name": "Eugene",
          "ip address": "46.168.181.79"
```

## Access JSON Values

```
SELECT data->>'email'
FROM friend
ORDER BY 1
LIMIT 5;
?column?
```

aalexandere0@europa.eu aalvarezdk@miitbeian.gov.cn aandrewsd9@usda.gov aarmstrong61@samsung.com abarnes55@de.vu

## Concatenate JSON Values

```
SELECT data->>'first name' || ' ' ||
       (data->>'last_name')
FROM friend
ORDER BY 1
LIMIT 5;
    ?column?
 Aaron Alvarez
 Aaron Murphy
 Aaron Rivera
 Aaron Scott
 Adam Armstrong
```

## JSON Value Restrictions

```
SELECT data->>'first name'
FROM friend
WHERE data->>'last name' = 'Banks'
ORDER BY 1:
 ?column?
Bruce
 Fred
-- the JSON way
SELECT data->>'first name'
FROM friend
WHERE data::jsonb @> '{"last name" : "Banks"}'
ORDER BY 1:
 ?column?
Bruce
 Fred
```

### Single-Key JSON Index

```
-- need double parentheses for the expression index
CREATE INDEX friend idx ON friend ((data->>'last name'));
EXPLAIN SELECT data->>'first name'
FROM friend
WHERE data->>'last name' = 'Banks'
ORDER BY 1:
                                  QUERY PLAN
 Sort (cost=12.89..12.90 rows=3 width=123)
   Sort Key: ((data ->> 'first name'::text))
   -> Bitmap Heap Scan on friend (cost=4.30..12.87 rows=3 width=123)
         Recheck Cond: ((data ->> 'last name'::text) = 'Banks'::text)
         -> Bitmap Index Scan on friend idx (cost=0.00..4.30 rows=3 ...
               Index Cond: ((data ->> 'last name'::text) = 'Banks'::t...
```

# JSON Calculations

```
SELECT data->>'first name' || ' ' || (data->>'last name'),
      data->>'ip address'
FROM friend
WHERE (data->>'ip address')::inet <<= '172.0.0.0/8'::cidr
ORDER BY 1;
   ?column?
                    ?column?
Lisa Holmes | 172.65.223.150
Walter Miller | 172.254.148.168
SELECT data->>'gender', COUNT(data->>'gender')
FROM friend
GROUP BY 1
ORDER BY 2 DESC:
 ?column? | count
Male
              507
 Female
              493
```

# 6. JSONB

#### Like the JSON data type, except

- Values are native JavaScript data types: text, number, boolean, null, subobject
- Indexing of all keys and values
- Stored in compressed format
- Sorts keys to allow binary-search key look up
- Does not preserve key order
- Does not preserve whitespace syntax
- Retains only the last duplicate key

hstore is similar non-hierarchical key/value implementation.

# JSON vs. JSONB Data Types

## JSONB Index

```
CREATE TABLE friend2 (id SERIAL, data JSONB);

INSERT INTO friend2
SELECT * FROM friend;

-- jsonb_path_ops indexes are smaller and faster,
-- but do not support key-existence lookups.

CREATE INDEX friend2_idx ON friend2
USING GIN (data);
```

## JSONB Index Queries

```
SELECT data->>'first name'
FROM friend2
WHERE data @> '{"last name" : "Banks"}'
ORDER BY 1:
 ?column?
 Bruce
 Fred
EXPLAIN SELECT data->>'first name'
FROM friend2
WHERE data @> '{"last name" : "Banks"}'
ORDER BY 1:
                            OUERY PLAN
 Sort (cost=24.03..24.04 rows=1 width=139)
   Sort Key: ((data ->> 'first name'::text))
   -> Bitmap Heap Scan on friend2 (cost=20.01..24.02 rows=1 ...
         Recheck Cond: (data @> '{"last name": "Banks"}'::jsonb)
         -> Bitmap Index Scan on friend2 idx (cost=0.00..20.01 .....
               Index Cond: (data @> '{"last name": "Banks"}'::js...
```

## JSONB Index Queries

```
SELECT data->>'last name'
FROM friend2
WHERE data @> '{"first name" : "Jane"}'
ORDER BY 1:
 ?column?
 Tucker
 Williams
EXPLAIN SELECT data->>'last name'
FROM friend2
WHERE data::jsonb @> '{"first name" : "Jane"}'
ORDER BY 1:
                            OUERY PLAN
 Sort (cost=24.03..24.04 rows=1 width=139)
   Sort Key: ((data ->> 'last name'::text))
   -> Bitmap Heap Scan on friend2 (cost=20.01..24.02 rows=1 ...
         Recheck Cond: (data @> '{"first name": "Jane"}'::jsonb)
         -> Bitmap Index Scan on friend2 idx (cost=0.00..20.01 ...
               Index Cond: (data @> '{"first name": "Jane"}'::js...
```

## JSONB Index Queries

```
SELECT data->>'first name' || ' ' || (data->>'last name')
FROM friend2
WHERE data @> '{"ip address" : "62.212.235.80"}'
ORDER BY 1;
    ?column?
 Theresa Schmidt
EXPLAIN SELECT data->>'first name' || ' ' || (data->>'last name')

   Sort Key: ((((data ->> 'first name'::text) || ' '::text) || ...
   -> Bitmap Heap Scan on friend2 (cost=20.01..24.03 rows=1 ...
         Recheck Cond: (data @> '{"ip address": "62.212.235.80"}'...
         -> Bitmap Index Scan on friend2 idx (cost=0.00..20.01 ...
               Index Cond: (data @> '{"ip address": "62.212.235....
```

## 7. Row Types

```
CREATE TYPE drivers_license AS
(state CHAR(2), id INTEGER, valid_until DATE);

CREATE TABLE truck_driver
(id SERIAL, name TEXT, license DRIVERS_LICENSE);

INSERT INTO truck_driver
VALUES (DEFAULT, 'Jimbo Biggins', ('PA', 175319, '2017-03-12'));
```

## Row Types

```
SELECT *
FROM truck driver;
         name
id |
                             license
 1 | Jimbo Biggins | (PA,175319,2017-03-12)
SELECT license
FROM truck driver;
        license
 (PA, 175319, 2017-03-12)
-- parentheses are necessary
SELECT (license).state
FROM truck driver;
 state
 PΑ
```

# 8. Character Strings

```
$ cd /tmp
$ wget http://web.mit.edu/freebsd/head/games/fortune/datfiles/fortunes
$ psql postgres

CREATE TABLE fortune (line TEXT);

COPY fortune FROM '/tmp/fortunes' WITH (DELIMITER E'\x1F');
```

## 8.1 Case Folding and Prefix

```
SELECT * FROM fortune WHERE line = 'underdog';
 line
SELECT * FROM fortune WHERE line = 'Underdog';
   line
Underdog
SELECT * FROM fortune WHERE lower(line) = 'underdog';
   line
Underdog
```

# Case Folding

# **Indexed Case Folding**

```
CREATE INDEX fortune_idx_lower ON fortune (lower(line));

EXPLAIN SELECT * FROM fortune WHERE lower(line) = 'underdog';

QUERY PLAN

Bitmap Heap Scan on fortune (cost=14.70..468.77 rows=295 ...

Recheck Cond: (lower(line) = 'underdog'::text)

-> Bitmap Index Scan on fortune_idx_lower (cost=0.00.....

Index Cond: (lower(line) = 'underdog'::text)
```

# String Prefix

```
SELECT line

ORDER BY 1:
                                          QUERY PLAN
 Sort (cost=481.61..482.35 rows=295 width=36)
   Sort Key: line
   -> Bitmap Heap Scan on fortune (cost=15.44..469.51 rows=295 ...
         Filter: (lower(line) ~~ 'mop%'::text)
         -> Bitmap Index Scan on fortune idx ops lower (cost=0...
               Index Cond: ((lower(line) ~>=~ 'mop'::text) AND (...
```

#### 8.2. Full Text Search

- Allows whole-word or word prefix searches
- Supports and, or, not
- Converts words to lexemes
  - stemming
  - 21 languages supported
  - 'Simple' search config bypasses stemming
- Removes stop words
- Supports synonyms and phrase transformations (thesaurus)

## Tsvector and Tsquery

```
SHOW default text search config;
default text search config
pg catalog.english
SELECT to tsvector('I can hardly wait.');
   to tsvector
 'hard':3 'wait':4
SELECT to tsquery('hardly & wait');
   to tsquery
 'hard' & 'wait'
```

## Tsvector and Tsquery

# Indexing Full Text Search

```
CREATE INDEX fortune_idx_ts ON fortune
USING GIN (to_tsvector('english', line));
```

#### Full Text Search Queries

```
SELECT line
